Accountability for all CFM defects on your manual crimp presses

- Adaptable to all manual crimp presses with Crimp Force Monitors (CFM's)
- The operator inserts the defect crimp until it touches the trigger sensor. The chopper fires and cuts the defect sample.
- The defect crimp falls through a metal detector sensor into a locked scrap box. When the metal detector "sees" the defect the CFM is automatically reset for the operator to continue.
- At the end of the shift the quality people unlock the scrap box and compare the CFM defect count with the number of defects in the lock box.
- Absolute accountability of all CFM defects.
- Wire sizes from AWG 20 - AWG 10
- Adjustable cut wire length
- No press or applicator modifications required. Simply place the smart chopper on the work table in a convenient position for the operator.
